

BuffaloSpeed MT5 Client Handover Guide

1) What BuffaloSpeed does

BuffaloSpeed is an automated MetaTrader 5 (MT5) Expert Advisor (EA) that:

- scans multiple symbols from a configured symbol list,
- generates trade signals using EMA crossover logic,
- calculates lot size from account risk settings,
- opens trades with SL/TP checks against broker stop rules,
- manages open positions using break-even and trailing stop,
- blocks new trades if drawdown/daily loss limits are breached,
- displays a live dashboard on chart,
- validates license key before trading.

2) Installation (MT5)

1. Open MT5 -> File -> Open Data Folder.
2. Go to 'MQL5/Experts/'.
3. Copy these files into that folder:
 - BuffaloSpeed.mq5
 - BuffaloLogger.mqh
 - BuffaloDashboard.mqh
 - BuffaloSymbolManager.mqh
 - BuffaloSignalEngine.mqh
 - BuffaloMoneyManager.mqh
 - BuffaloTradeManager.mqh
 - BuffaloRiskManager.mqh
4. Restart MT5 (or refresh Navigator).
5. Open 'BuffaloSpeed.mq5' in MetaEditor and compile.

3) Setup before running

- Attach BuffaloSpeed to one chart.
- Enable Algo Trading in MT5.
- Set inputs:
 - License: 'InpLicenseKey'
 - Symbols: 'InpSymbols' (comma-separated, e.g. EURUSD,GBPUSD,USDJPY)
 - Signal: timeframe + MA periods
 - Risk: per-trade %, max daily loss %, max drawdown %
 - Protection: stop loss, take profit, break-even, trailing stop
 - Execution: magic number, slippage

4) How execution works

1. On init: license + symbol validation + module setup.
2. Every timer cycle:
 - risk check runs,
 - each configured symbol is processed,
 - duplicate same-candle entries are prevented,
 - signal is evaluated,
 - lot size is calculated,
 - order is sent only if broker stop-distance constraints are valid.

3. If position is open, SL is managed by break-even/trailing logic.

5) How to monitor it

Use the chart dashboard for:

- License status
- Symbol count
- Risk check state (OK/BLOCKED)
- Open positions
- Balance and Equity

Also check MT5 Journal/Experts tabs for warnings or rejected orders.

6) Testing path (recommended)

- Compile in MetaEditor with 0 errors.
- Run Strategy Tester by symbol/timeframe.
- Run forward demo testing 2-4 weeks.
- Confirm VPS uptime and reconnection behavior.
- Validate broker stop/freeze levels.

7) Live deployment policy

- Ready for demo testing: Yes.
- Ready for live trading: Only after all validation checks above pass.

8) Client operating checklist (quick)

- ☐ License key accepted
- ☐ Algo Trading enabled
- ☐ Correct symbols configured
- ☐ Risk parameters approved
- ☐ Demo validation completed
- ☐ Live go-ahead approved
